

Work Reference

Faridreza Momtaz Zandi joined Lumi Labs AB as a **Software Engineering Intern**, working on **LingoLooper**, our AI-powered conversational language-learning game, from September 1, 2025 to June 6, 2026.

Over the course of his engagement he worked as a full-stack engineer, taking features from concept to production across our backend (ASP.NET Core), our Unity game client, and our React admin dashboard.

Selected Contributions

- **Player feedback system** — designed and shipped a complete in-game “Report an Issue” feature spanning the Unity client, the backend API, and admin triage tools, iterating it over several months in close collaboration with code review.
- **LLM observability** — integrated distributed tracing across all of our AI endpoints and background jobs, a cross-cutting capability the whole team now relies on to debug conversation quality.
- **Emotion-aware conversations** — added real-time emotion detection to the conversation pipeline so characters respond to the player’s tone, modeled cleanly end-to-end with sensible cost and rate-limiting safeguards.
- **Annual player recap** — built a “year in review” player-statistics feature, delivered through to a branded email experience.

Performance

- **Self-directed and independent** — took features from idea to production with minimal supervision.
- **Full of initiative** — repeatedly brought creative ideas to the table unprompted and built them out to see what worked, with the judgment to cut what didn’t.
- **Positive, can-do attitude** — an uplifting presence on the team who met every problem with energy and optimism.
- **Highly coachable** — absorbed review feedback gracefully and kept iterating, always improving rather than getting defensive.

We are very grateful for Farid’s contributions. His initiative, full-stack range, and the positive energy he brought to the team made a real difference, and we wish him every success in his future career.
